

# Iron Skewer Grill — why menu-source repair returned `repairedCount: 0`

**Date:** 2026-08-19  
**Vendor:** `cmqt0ye3i0001smo1qt9js0j9` (Iron Skewer Grill, `iron-skewer-grill`)  
**Status:** Investigation only — no data was modified

## Root cause (first)

The repair script skipped this vendor because **Open Order is already aligned and a native Menu Builder catalog is already published.**

Exact skip condition in `vendorNeedsOpenOrderAdoptionRepair` :

```
const menuSourceMismatch = input.menuSource !== expected; // false
const hasNativePublished = input.published.some((row) =>
  snapshotIsNativeOpenOrderBuilder(row.canonicalSnapshot)
); // true
return menuSourceMismatch || !hasNativePublished; // false → skip
```

Stored facts that produce that skip:

| Field                              | Value                                                         |
|------------------------------------|---------------------------------------------------------------|
| <code>orderRoutingMode</code>      | <code>manual_dashboard</code>                                 |
| Expected <code>menuSource</code>   | <code>open_order</code>                                       |
| Persisted <code>menuSource</code>  | <code>open_order</code>                                       |
| Authority provider                 | <code>open_order</code>                                       |
| Published <code>MenuVersion</code> | 1 row, <code>sourcePayloadKind = open_order_builder_v1</code> |

That eligibility rule assumes: *if a native builder menu is published, availability is already Open Order–controlled and needs no adoption/restore.*

That assumption is wrong for this vendor. The **winning catalog is native Open Order, and every product in it is unavailable** (`canonical product.isAvailable = false` and matching `MenuItem.isAvailable = false`). Dashboard and storefront are consistent with that data. Repair never looks at availability when a native publish exists.

This is **not**:

- a false-positive native-publish detection (the published snapshot really is `open_order_builder_v1` )
- a duplicate-row winner bug (each `oo:prod:` id has exactly one `MenuItem` )
- a cache/read-path disagreement (readiness and storefront select the same published native version)

It **is** incomplete repair eligibility plus a live native catalog that was published with all items unavailable.

## Current database state

### Vendor / authority

| Field                                           | Value                                                                                                   |
|-------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| <code>orderRoutingMode</code>                   | <code>manual_dashboard</code> (Open Order / tablet)                                                     |
| <code>menuSource</code>                         | <code>open_order</code>                                                                                 |
| Current menu authority                          | <code>open_order</code>                                                                                 |
| <code>posType</code> / <code>posProvider</code> | <code>clover</code> / <code>clover</code> ( <code>posConnectionStatus</code> = <code>connected</code> ) |
| <code>deletedAt</code>                          | <code>null</code>                                                                                       |

Routing and menu source already match. Repair had nothing to realign on those fields.

### MenuVersion records (newest first)

| id                                     | state            | publishedAt (UTC)   | origin ( <code>sourcePayloadKind</code> ) | prod |
|----------------------------------------|------------------|---------------------|-------------------------------------------|------|
| <code>cmqud83uf00075p6m89rkxo1a</code> | <b>draft</b>     | —                   | <code>deliverect_menu_webhook_v1</code>   | 21   |
| <code>cmt0g0bkk0002wot5cwk6b1lm</code> | <b>published</b> | 2026-08-19 18:46:26 | <code>open_order_builder_v1</code>        | 8    |
| <code>cmt0eaxwx00022eoe9l4x8r1m</code> | archived         | 2026-08-19 17:58:42 | <code>open_order_builder_v1</code>        | 8    |
| <code>cmslaxm0a000210s8ncprlcdn</code> | archived         | 2026-08-09 04:27:49 | <code>open_order_builder_v1</code>        | 8    |
| <code>cmrgzc38i00092z38en0261u9</code> | archived         | 2026-07-11 23:12:50 | <code>square_catalog_v1</code>            | 25   |

|                                                                  |          |                        |                            |    |
|------------------------------------------------------------------|----------|------------------------|----------------------------|----|
| several older<br>open_order_builder_v1<br>archived rows (Jun 30) | archived | Jun 30                 | native builder             | 8  |
| cmqtxlqoh0008kcv3jjfgnfx7                                        | archived | 2026-06-25<br>20:05:39 | deliverect_menu_webhook_v1 | 21 |

Native builder **does** exist and is the sole published catalog. From Aug 9 onward, every native snapshot has **0 available products**. Earlier native snapshots (Jun 30) had all 8 available. The Square catalog (Jul 11) still has 25/25 snapshot-available.

## MenuItem rows

54 live rows, **no duplicate** deliverectProductId s.

| Origin prefix      | count | isAvailable=true | isAvailable=false |
|--------------------|-------|------------------|-------------------|
| Deliverect (other) | 21    | 0                | 21                |
| sq:prod:           | 25    | 0                | 25                |
| oo:prod:           | 8     | 0                | 8                 |

Builder categories: 3 VendorMenuCategory rows.

All 8 operational builder items match the published snapshot 1:1. Example: Mediterranean Skewer ( oo:prod:cmr04x3ng000bputiqzcec1kn ) — snapshot isAvailable=false , single MenuItem isAvailable=false .

## Why Menu Builder can look “published and complete”

Menu Builder publish validation ( validateOpenOrderMenuBuilderState ) does **not** require any available items. availableItemCount is informational.

publishOpenOrderMenuFromBuilder also does **not** use the import-path NO\_AVAILABLE\_PRODUCTS guard.

So a vendor can publish a structurally complete native menu while every item is isAvailable=false . Publish status then shows live ( hasPublishedOpenOrderMenu ), which matches “published and complete.” Sold-out toggles in builder are bound to the same MenuItem.isAvailable flag that is currently false in the database.

## Code path for this vendor

### 1. Repair eligibility

`repairInconsistentVendorMenuSourceOwnership` :

1. Load vendor → `manual_dashboard` / `open_order`
2. Load **published-only** MenuVersions → one `open_order_builder_v1`
3. `vendorNeedsOpenOrderAdoptionRepair` → **false**
4. `continue` → `repairedCount: 0`

It never inspects `MenuItem.isAvailable` or snapshot product availability.

Even if eligibility were true, `restoreAvailabilityFromAdoptedSnapshot` would copy **snapshot** `isAvailable` . The current native snapshot is all false, so a restore-from-winner would still leave every item unavailable.

## 2. Catalog winner (storefront + readiness)

`loadActiveMenuVersionForVendor` when provider is `open_order` :

1. Prefer published native builder
2. Else published Square/Deliverect
3. Else archived native / adopted

This vendor hits step 1: published native `cmt0g0bkk0002wot5cwk6b1lm` .

That is the correct winner-selection rule given a native publish. Square's archived 25-item catalog is intentionally not selected.

## 3. Dashboard / setup readiness

`loadVendorMenuReadinessSummaries` :

- `hasPublishedMenuVersion` = active snapshot parsed → **true**
- `operational ids = 8 oo:prod:` winner rows
- `hasOperationalItems` = **true**
- `hasAvailableOperationalItems` = any operational row with `isAvailable=true` → **false**

Setup copy: **"Menu items exist but none are available right now."**

## 4. Storefront overlay

Display is built from the native snapshot (8 products). Overlay uses each product's operational MenuItem `isAvailable` . All eight are false → every customer item unavailable. No duplicate-pool AND bug here ( `matchingRowCount` is 1 for every product).

## Which of the five hypotheses?

| # | Hypothesis                                          | Verdict                                                                                                                        |
|---|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| 1 | Repair eligibility is incomplete                    | <b>Yes.</b> Native publish + aligned <code>menuSource</code> is treated as healthy even when every native item is unavailable. |
| 2 | Runtime winner selection is still wrong             | <b>No for this vendor.</b> Native published catalog should win.                                                                |
| 3 | Already repaired; stale cache/read path             | <b>No.</b> Live rows and snapshot agree: all unavailable.                                                                      |
| 4 | Native Open Order publish detected incorrectly      | <b>No.</b> Kind is <code>open_order_builder_v1</code> ; published at 2026-08-19 18:46 UTC.                                     |
| 5 | Duplicate rows, wrong <code>isAvailable</code> wins | <b>No.</b> No duplicate product ids.                                                                                           |

## Likely history (not a second bug in winner selection)

1. Deliverect and Square catalogs were imported (21 and 25 items, snapshot-available).
2. A native 8-item builder menu existed and used to be available (Jun 30 snapshots).
3. From Aug 9, native snapshots are 8/8 unavailable — consistent with an earlier routing switch that soft-disabled Open Order items ( `menuItemShouldRemainAvailable` keeps only the active **origin** prefix while Square/Deliverect own the menu), then a later publish that **baked** those false flags into `open_order_builder_v1` .
4. Square/Deliverect live rows remain disabled (expected after leaving those providers).
5. Repair was designed to adopt/restore **provider** catalogs when **no** native publish exists. This vendor already has a native publish, so it is skipped.

## What a correct follow-up would need (not applied)

Do **not** blindly set every item `available=true` .

A follow-up should treat “native published but zero available products, while an older native snapshot or builder intent says they were available” as a repair case — restore Open Order–controlled availability for **oo:prod: items that are the published native catalog**, without resurrecting retired Square/Deliverect rows, and without overriding items that are explicitly sold out *after* Open Order is already authority.

Until that exists, `menu:repair-source-ownership` will keep returning `repairedCount: 0` for this vendor.
