

Menu Architecture Phase 2 Migration Report

Date: 2026-07-24

Based on: docs/reports/menu-architecture-integration-neutral-audit.md

Scope: Additive schema, TS renames, dual-read/write location, identity helpers, PEM hybrid fields, diagnostics, enforcement tests

Not in scope: Phase 3 (remove legacy columns / rename Prisma fields)

Exact schema additions

MenuImportJob

Column	Type	Notes
sourceLocationId	TEXT nullable	Generic import location id
Index	MenuImportJob_sourceLocationId_idx	

deliverectLocationId **retained** (deprecated in schema comments).

ProviderEntityMapping (hybrid ExternalMenuMapping — no new table)

Column	Type	Notes
environment	TEXT nullable	e.g. sandbox/production
externalParentId	TEXT nullable	e.g. Square ITEM id for a variation
externalAccountId	TEXT nullable	e.g. Square merchant id
externalVersion	TEXT nullable	
metadata	JSONB nullable	Non-secret diagnostics only
Index	(vendorId, provider, externalParentId)	

externalLocationId already existed.

Migration

- File:
prisma/migrations/20260724180000_menu_architecture_phase2_additive/migration.sql
- Status: applied (after hotfix for wrong enum name DELIVERECT_API_PULL)

Rollback (additive only)

```
DROP INDEX IF EXISTS "ProviderEntityMapping_vendorId_provider_externalParentId_idx";
ALTER TABLE "ProviderEntityMapping" DROP COLUMN IF EXISTS "metadata";
ALTER TABLE "ProviderEntityMapping" DROP COLUMN IF EXISTS "externalVersion";
ALTER TABLE "ProviderEntityMapping" DROP COLUMN IF EXISTS "externalAccountId";
ALTER TABLE "ProviderEntityMapping" DROP COLUMN IF EXISTS "externalParentId";
ALTER TABLE "ProviderEntityMapping" DROP COLUMN IF EXISTS "environment";
```

```
DROP INDEX IF EXISTS "MenuImportJob_sourceLocationId_idx";
ALTER TABLE "MenuImportJob" DROP COLUMN IF EXISTS "sourceLocationId";
```

Then `prisma migrate resolve` / restore migration history as needed. No historical orders rewritten.

Compatibility read/write matrix

Field / concern	New write	Legacy write	Read path
Import location (Square)	<code>sourceLocationId</code> only	Never <code>deliverectLocationId</code>	<code>jobSourceLocationId()</code> prefers new, falls back legacy
Import location (Deliverect)	Dual-write both	Continues <code>deliverectLocationId</code>	Same helper
Canonical product id	Snapshot still <code>deliverectId</code>	unchanged	<code>productExternalId()</code>
Live MenuItem id	Still <code>deliverectProductId</code> column	unchanged	<code>menuItemSourceEntityId()</code>
Variant leaf	Still <code>deliverectVariantParentPlu</code>	Square must stay null	<code>isVariantLeafProduct</code> / <code>isVariantLeafMenuItem</code>
Square parent ITEM	Snapshot <code>sourceParentExternalId</code>	+ PEM <code>externalParentId</code> on re-import	Mapping / diagnostics
Types	<code>OpenOrderCanonical*</code>	Deprecated <code>MennyuCanonical*</code> aliases	Prefer <code>OpenOrder*</code>

Files changed (high level)

Schema / migration

- `prisma/schema.prisma`
- `prisma/migrations/20260724180000_menu_architecture_phase2_additive/migration.sql`

Domain

- `src/domain/menu-import/canonical.schema.ts` — `OpenOrder*` names + aliases
- `src/domain/menu-import/canonical-identity.ts` — expanded helpers + job location dual-read
- `src/domain/menu-import/menu-import-job-location.ts` — dual-write policy
- `src/domain/menu-import/customer-menu-browse.ts` — helper-only leaf reads
- `src/domain/menu-import/index.ts` — exports
- `src/domain/menu-import/phase2-provider-field-enforcement.test.ts` — new
- Broad TS rename: `Mennyu*` → `OpenOrder*` across ~50 files (aliases retained)

Import / mapping / publish / storefront

- `src/lib/integrations/square/square-menu-import.service.ts`
- `src/services/menu-import-phase1b.service.ts`
- `src/lib/integrations/provider-mapping.service.ts`
- `src/services/menu-publish-from-canonical.service.ts`

- `src/services/vendor-customer-menu.service.ts`
- `src/components/menu-import/MenuImportAdvancedDetails.tsx`
- Vendor/admin menu-import job pages (pass `sourceLocationId`)

Diagnostics

- `src/lib/admin-menu-architecture-consistency.server.ts`
- `src/app/admin/(dashboard)/menu-architecture-consistency/page.tsx`
- `src/app/api/admin/menu-architecture-consistency/route.ts`

Backfill results (this environment)

Metric	Count
<code>MenuImportJob</code> total	72
With <code>sourceLocationId</code> after backfill	72
Square jobs with legacy location only	0
Deliverect jobs missing both location fields	0
Ambiguous other sources (reported, not guessed)	0
PEM rows with <code>externalParentId</code>	0 (populated on next Square re-import)

Ambiguous policy: only backfill when `source` is unambiguously Square or Deliverect. Other sources left alone and reported.

Remaining legacy reads (intentional until Phase 3)

Area	Why still present
Deliverect transform / cart-deliverect-variant-resolution	Provider routing / nesting (A/D) — may read leaf PLU fields
Square order mapper	Reads <code>deliverectProductId</code> as PEM internal key (D) — namespaced Square ids
Snapshot JSON keys <code>deliverectId</code> , <code>menu.deliverect</code>	Persisted contract; dual-key later
Prisma column names	Additive phase only
Deprecated <code>MennyuCanonical*</code> aliases	Compat re-exports

Generic modules enforced **not** to directly property-read leaf fields: `menu-publish-from-canonical` , `vendor-customer-menu` , `vendor-customer-menu-cache` , `customer-menu-browse` .

Tests run

```
npx vitest run src/domain/menu-import ...
+ square normalizer / multi-variation / import service
```

```
+ menu-import-publish-eligibility
+ menu-parity.analyze
+ deliverect phase1a-pipeline
```

Result: 9 files, 64 tests passed (includes new Phase 2 enforcement suite).

Enforcement coverage:

- Square normalization cannot set leaf PLU/name
 - Square import writers never `deliverectLocationId: locationId`
 - Manual menus need no mapping for browse
 - Deliverect leaves still excluded from browse
 - Generic modules have no direct `.deliverectVariantParentPlu / Name` reads
-

Mapping contract (chosen)

Keep and evolve `ProviderEntityMapping` as the hybrid `ExternalMenuMapping`. Do **not** add a competing table.

Required identity: `(vendorId, provider, internalEntityType, internalEntityId, externalLocationId) → externalId`

Optional Phase 2: `externalParentId, externalAccountId, environment, externalVersion, metadata`.

Recommendation for Phase 3

1. Introduce explicit `isVariantLeaf` (or stop using PLU field name in generic code paths entirely after dual-write).
2. Dual-write optional snapshot keys (`sourceExternalId`) while keeping `deliverectId` .
3. Prove zero dual-read fallbacks for `sourceLocationId` (diagnostics clean).
4. Only then expand/contract rename of Prisma columns and delete deprecated aliases.
5. Do **not** delete `deliverectVariantParentPlu` until Deliverect transform is migrated to a namespaced Deliverect DTO.

Do not start Phase 3 until PEM parent backfill + Square re-import have run on production-like data and consistency page is clean for Poke Sea / Deliverect vendors.

How to use diagnostics

- UI: `/admin/menu-architecture-consistency` (optional `?vendorId=`)
- JSON: `GET /api/admin/menu-architecture-consistency?vendorId=...` (platform admin session)
