

Provider UX Regression Audit & Dead Code Cleanup

Date: 2026-07-08

Summary

Confirmed provider-aware integration UX is consistent across vendor setup, integrations hub, admin vendor detail, menu imports, and kitchen mode. Removed two unused legacy components. Public/customer and checkout surfaces remain free of provider diagnostics. Routing, payouts, and injection behavior unchanged.

Files removed

File	Reason
<code>src/components/vendor/VendorIntegrationReadinessCard.tsx</code>	Zero callers after setup/hub migration
<code>src/components/vendor/VendorSquareSetupSummary.tsx</code>	Zero callers; superseded by <code>VendorIntegrationsSection</code>

Files added

File	Purpose
<code>src/lib/provider-ux-regression.test.ts</code>	Dead-code scan, cross-surface consistency, inactive-provider blocker rules

Remaining provider-aware entry points

Surface	Entry point	Provider model
Vendor setup	<code>loadVendorIntegrationsViewModel(..., "setup")</code> → <code>VendorIntegrationsSection</code>	Active routing + menu source; collapsed available
Integrations hub	<code>loadVendorIntegrationsViewModel(..., "hub")</code> → <code>VendorIntegrationsSection</code>	+ connected integrations; hub CTAs

Shared builder	<code>buildVendorSetupIntegrationsView</code> in <code>vendor-setup-integrations.ts</code>	Single source of truth
Shared loader	<code>vendor-integrations-view.server.ts</code>	Wraps observability + dashboard context
Menu imports	<code>vendorMenuImportsPageSubtitle</code> , <code>getProviderDisplayProfile</code>	Routing-aware subtitles
Kitchen mode	<code>vendorKitchenStatusWarning</code> , <code>vendorKitchenModeNotice</code>	Provider-aware operational copy
Admin vendor detail	<code>AdminVendorOrderRoutingSection</code> , diagnostics panels	Mode selector + gated diagnostics
Square OAuth detail	<code>VendorSquareConnectionCard</code> on <code>/integrations/square</code>	Actionable Square setup only

Retained (not dead):

- `getVendorIntegrationObservability` — used by shared loader
- `VendorSquareConnectionCard` — Square detail page
- `integratedOrderRoutingLabel` — menu imports labels (deprecated alias, still used)
- Deliverect/Square menu import panels — provider-specific actionable pages

Manual / Deliverect / Square QA (code + test verification)

Manual / tablet vendor

- **Active routing:** Open Order Dashboard / Tablet — Ready when mode selected
- **Inactive:** Square, Deliverect, Toast in Available — neutral status only
- **Kitchen:** Dashboard/tablet notice; no POS missing warnings
- **Setup/hub:** No Square or Deliverect required in checklists beyond routing-mode-specific `pos` row (manual dashboard ready)

Deliverect vendor

- **Active routing:** Deliverect — readiness from Deliverect adapter only
- **Inactive Square:** Available / Not configured — never `needs_attention`
- **Menu source:** Deliverect card independent of routing
- **Admin:** Deliverect Menu/POS section; no Square warnings in routing selector
- **Kitchen:** Deliverect live/POS-managed UI paths unchanged

Square vendor

- **Active routing:** Square — readiness from Square adapter only

- **Inactive Deliverect:** neutral in Available/Connected
- **Menu source:** Square catalog card with menu import CTA
- **Square detail:** OAuth/location on `/integrations/square`
- **Admin:** Square injection diagnostics gated to Square routing vendors

Public / customer

- Pod vendor menu page (`/[podSlug]/[vendorSlug]`) — no integration readiness, Square connection, or `SQUARE_ROUTING_LIVE` copy
- Checkout — no imports of vendor integration setup helpers

Behavior unchanged

- Checkout flow
- Payouts
- Square injection (`SQUARE_ROUTING_LIVE` , `routing.service`)
- Deliverect routing
- Manual/tablet routing

Tests / QA

Suite	Result
<code>provider-ux-regression.test.ts</code> (10)	Pass
<code>vendor-setup-integrations.test.ts</code> (16)	Pass
<code>admin-vendor-detail-provider.test.ts</code> (10)	Pass
<code>provider-display.test.ts</code> (19)	Pass
<code>vendor-order-routing-mode.test.ts</code> (16)	Pass
<code>admin-vendor-order-routing.test.ts</code> (5)	Pass
<code>npm run build</code>	Pass

Known limitations

- **Visual browser QA** not automated — consistency verified via source/tests, not live screenshots.
- `integratedOrderRoutingLabel` remains as deprecated alias; consolidation optional later.
- **Toast** placeholder still shown in Available integrations with no connection flow.

- **Kitchen “Needs attention”** on individual orders (routing retry) is operational, not integration-setup diagnostics.
- **Vendor integrations hub** and **setup** share model but hub exposes more CTAs — intentional.
